**SEMESTER I EXAMINATION (RESIT) – 2012/2013**

---

**PHYC 10160**

**Physics for Engineers II**

Dr P. J. M. van der Burgt  
Professor P. A. Dunne  
Dr. I. Mercer \*

**Time Allowed: 2 Hours**

**Instructions for Candidates**

Candidates should attempt **all four** questions. Clearly mark your attempted questions on the front cover of the answer booklets. All questions carry equal marks. The marks allocated to each part of a question are indicated in brackets.

**Instructions for Invigilators**

Non-programmable calculators are permitted.

1.
  - a) With the aid of a labeled diagram, describe the Bohr model of the hydrogen atom. [2 marks]
  - b) Derive the following relationship for a hydrogen atom according to the Bohr model:

$$r_n = a n^2$$

where  $r_n$  are the permitted radii of the electron orbit,  $n = 1, 2, 3, \dots$ , and 'a' is a constant. Determine 'a' in terms of variables that you define.

*Hint: equate Coulomb's law with the centripetal force acting on an electron, and then take angular momentum to be quantized according to Bohr.* [4 marks]

- c) Give a relationship for Heisenberg's quantum uncertainty principle, clearly defining variables. Reason why atoms don't collapse due to this principle. [2 marks]
- d) A hydrogen atom makes a transition from the 5<sup>th</sup> to the 2<sup>nd</sup> quantum state. What is the wavelength of light emitted? Take the allowed energies,  $E$  of a hydrogen atom to be given by:  $E_n = -(13.60 \text{ eV})/n^2$  where  $n = 1, 2, 3, \dots$  [2 marks]

2.
  - a) State Coulomb's Law and Gauss's Law for electric and magnetic fields. Illustrate with one diagram each how Gauss's Law applies to the field of an electric dipole and the field of a magnetic dipole. [5 marks]
  - b) Two point charges  $q_1 = -5.5 \times 10^{-9} \text{ C}$  and  $q_2 = +5.5 \times 10^{-9} \text{ C}$  are fixed in a vacuum at apexes A and B of an equilateral triangle ABC of side 0.1 m. For this:
    - i) Describe the electric field in the neighbourhood of the two charges by drawing field lines. [2 marks]
    - ii) Calculate the value and direction of the electric field at C. [2 marks]
    - iii) Calculate the electric potential at C. [1 mark]

3.

- a) State Faraday's Law and Lenz's Rule in relation to electromagnetic induction. [4 marks]
- b) Describe the principle of an alternating current generator, deriving an equation for the EMF generated as a loop rotates at a constant rate. You should assume that the loop is rectangular with sides  $a$  and  $b$ . [4 marks]
- c) What are the values of the peak and root-mean-square EMF generated by a coil of area  $0.1 \text{ m}^2$  and 1,0000 turns, rotating at 50 Hz perpendicular to a uniform magnetic field of  $10^{-1} \text{ T}$ ? [2 marks]

4.

- a) Briefly explain what is meant by the nuclear processes alpha and beta decay, and give an example of each process. [3 marks]
- b) Explain the concept of nuclear binding energy, accompanied by a labelled graph of binding energy per nucleon versus the number of nucleons that explains why some elements undergo fission whilst some undergo fusion. [3 marks]
- c) Calculate the nuclear binding energy in MeV of the 92 protons and 146 neutrons in the nucleus of a  $^{238}\text{U}$  atom. Note the following: the mass of  $^{238}\text{U}$  atom = 238.05079 u; the mass of the Hydrogen atom = 1.00783 u; and the mass of the neutron = 1.00866 u, where u is the atomic mass unit. [4 marks]

## Recommended Values of Physical Constants and Conversion Factors

(Sources: 2006 CODATA recommended values; <http://physics.nist.gov/constants>)

speed of light in vacuum,  $c = 299\,792\,458$  (exact)  $\text{m s}^{-1}$

electric (permittivity) constant,  $\epsilon_0 = 8.854\,187\,817\ldots \times 10^{-12}$  (exact)  $\text{F m}^{-1}$

magnetic (permeability) constant,  $\mu_0 = 12.566\,370\,614\ldots \times 10^{-7}$  (exact)  $\text{N A}^{-2}$

(unified) atomic mass unit,  $u = 1.660\,538\,782(83) \times 10^{-27}$   $\text{kg}$

alpha particle mass (in  $u$ ) =  $4.001\,506\,179\,127(62)$   $u$

atomic mass unit energy equivalent =  $1.492\,417\,830(74) \times 10^{-10}$   $\text{J}$

atomic mass unit energy equivalent (in  $\text{MeV}$ ) =  $931.494\,028(23)$   $\text{MeV}$

Avogadro constant,  $N_A = 6.022\,141\,79(30) \times 10^{23}$   $\text{mol}^{-1}$

Bohr radius,  $a_0 = 0.529\,177\,208\,59(36) \times 10^{-10}$   $\text{m}$

Bohr magneton,  $\mu_B = 927.400\,915(23) \times 10^{-26}$   $\text{J T}^{-1}$

Boltzmann constant,  $k = 1.380\,6504(24) \times 10^{-23}$   $\text{J K}^{-1}$

classical electron radius,  $r_e = 2.817\,940\,2894(58) \times 10^{-15}$   $\text{m}$

Compton wavelength of the electron,  $\lambda_C = 2.426\,310\,2175(33) \times 10^{-12}$   $\text{m}$

deuteron mass (in  $u$ ) =  $2.013\,553\,212\,724(78)$   $u$

electron mass (in  $u$ ),  $m_e = 5.485\,799\,0943(23) \times 10^{-4}$   $u$

elementary charge,  $e = 1.602\,176\,487(40) \times 10^{-19}$   $\text{C}$

molar mass of carbon-12 =  $12 \times 10^{-3}$  (exact)  $\text{kg mol}^{-1}$

neutron mass (in  $u$ ),  $m_n = 1.008\,664\,915\,97(43)$   $u$

Newtonian constant of gravitation,  $G = 6.674\,28(67) \times 10^{-11}$   $\text{m}^3 \text{kg}^{-1}$

nuclear magneton,  $\mu_N = 5.050\,783\,24(13) \times 10^{-27}$   $\text{J T}^{-1}$

Planck constant,  $h = 6.626\,068\,96(33) \times 10^{-34}$   $\text{J s}$

proton mass (in  $u$ ),  $m_p = 1.007\,276\,466\,77(10)$   $u$

Rydberg constant,  $R = 10\,973\,731.568\,527(73)$   $\text{m}^{-1}$

Stefan-Boltzmann constant,  $\sigma = 5.670\,400(40) \times 10^{-8}$   $\text{W m}^{-2} \text{K}$

triton mass (in  $u$ ) =  $3.015\,500\,7134(25)$   $u$

oOo
