SEMESTER II EXAMINATIONS - 2012/2013

School of Mechanical and Materials Engineering

MEEN10050 Energy Engineering

Professor M. Stack

Prof. M. Gilchrist

Prof. A. Ivankovic

Dr. D. Timoney*

Dr. S. Oxizidis

Time Allowed: 2 Hours

Instructions for Candidates

50 Marks (out of 100) are allocated for Section A (MCQ), based on all 20 Questions.

- Questions A1 to A20 carry equal marks (+2.5 marks each).
- Negative marks apply for incorrect answers (-0.625 marks each).
- Zero mark applies for a blank answer on any question.

*Please complete **MULTIPLE CHOICE “ANSWER SHEET”** using **HB Pencil**.*

50 Marks (out of 100) are allocated for Section B are based on any 2 Questions (25 marks each). Numbers in () brackets indicate marks allocated to each part of a question.

Fluid Property Data and Formulae are included at the end of this document.

Section A Multiple Choice - (please use MCQ Answer Sheet)
50 Marks are allocated for Section A (MCQ), based on all 20 Questions.

Question A1.

The thermal conductivity of an expanded polystyrene insulating board of 1 m^2 surface area is $0.03 \text{ W}\cdot\text{m}^{-1}\cdot\text{K}^{-1}$. If the surface temperatures of the board are 20°C and -1°C what thickness would be required to limit the heat flow to 15 W ?

- (A) 0.038 m
- (B) 0.042 m
- (C) 0.08 m
- (D) 0.8 m

Question A2.

Which of the following statements about a material is true?

- (A) A high U-value is a good insulator, and a high R-value is a good conductor.
- (B) A high U-value is a good conductor, and a high R-value is a good insulator.
- (C) A high U-value is a good insulator, and a high R-value is a good insulator.
- (D) A high U-value is a good conductor, and a high R-value is a good conductor.

Question A3.

Considering heat losses from a building, which of the following is affected by changes in wind speed?

- (A) Radiation heat losses from the roof
- (B) Radiation heat losses from the walls
- (C) Convection heat losses from windows
- (D) Conduction heat losses from the floor to the ground

Question A4.

A triple glazed window consists of 3 clear glass panes of 3 mm thickness each, separated by air cavities of 12 mm each. The window area is 2.0 m^2 . The thermal conductivity of each of the glass panes is $0.9 \text{ W}\cdot\text{m}^{-1}\cdot\text{K}^{-1}$ and of the air cavities is $0.032 \text{ W}\cdot\text{m}^{-1}\cdot\text{K}^{-1}$. The interior and exterior convection coefficients are $8 \text{ W}\cdot\text{m}^2\cdot\text{K}^{-1}$ and $25 \text{ W}\cdot\text{m}^2\cdot\text{K}^{-1}$. What is the U-value of the window?

- (A) $0.46 \text{ W}\cdot\text{m}^{-2}\cdot\text{K}^{-1}$
- (B) $1.08 \text{ W}\cdot\text{m}^{-2}\cdot\text{K}^{-1}$
- (C) $1.32 \text{ W}\cdot\text{m}^{-2}\cdot\text{K}^{-1}$
- (D) $2.16 \text{ W}\cdot\text{m}^{-2}\cdot\text{K}^{-1}$

Question A5.

A well insulated external wall has a U-value of $0.265 \text{ W}\cdot\text{m}^{-2}\cdot\text{K}^{-1}$. The ambient air temperature is -10°C and the room air temperature is 20°C ? The interior convection coefficient is $8 \text{ W}\cdot\text{m}^2\cdot\text{K}^{-1}$ and exterior convection coefficient is $25 \text{ W}\cdot\text{m}^2\cdot\text{K}^{-1}$. What is the temperature of the interior surface?

- (A) -10.5°C
- (B) 12°C
- (C) 19°C
- (D) 22°C

Question A6.

A window with a surface area of 2.0 m^2 receives solar radiation of $800 \text{ W}\cdot\text{m}^{-2}$. If the absorptivity of the glazing is 0.1 and the reflectivity is 0.3 , what will be the solar radiation entering the room?

- (A) 160 W
- (B) 240 W
- (C) 480 W
- (D) 960 W

Question A7.

Which of the following quantities correspond to the heat engine shown below?

- (A) $T_H = 500^\circ\text{C}$, $T_L = 100^\circ\text{C}$, $Q_H = 100 \text{ J}$, $Q_L = 70 \text{ J}$, $W_{\text{net}} = 30 \text{ J}$
- (B) $T_H = 100^\circ\text{C}$, $T_L = 500^\circ\text{C}$, $Q_H = 100 \text{ J}$, $Q_L = 70 \text{ J}$, $W_{\text{net}} = 30 \text{ J}$
- (C) $T_H = 500^\circ\text{C}$, $T_L = 100^\circ\text{C}$, $Q_H = 70 \text{ J}$, $Q_L = 100 \text{ J}$, $W_{\text{net}} = 30 \text{ J}$
- (D) $T_H = 500^\circ\text{C}$, $T_L = 100^\circ\text{C}$, $Q_H = 70 \text{ J}$, $Q_L = 30 \text{ J}$, $W_{\text{net}} = 100 \text{ J}$

Question A8.

Air is trapped in a closed cylinder at an initial temperature of 426.85°C . The pressure is held constant whilst the volume is halved. The final temperature of the gas is;

- (A) 213.4°C
- (B) 853.7°C
- (C) 76.85°C
- (D) 426.85°C

Question A9.

A closed cylinder with an internal volume of 0.292 m^3 contains Carbon Dioxide (CO_2) gas at 18.9°C and at an absolute pressure of 189 kPa . Assuming ideal gas behaviour, the mass of CO_2 will be;

- (A) 0.001 kg
- (B) 0.0155 kg
- (C) 1.0 kg
- (D) 15.45 kg

Question A10.

The units of enthalpy H are

- (A) J
- (B) $\text{J}\cdot\text{kg}^{-1}$
- (C) $\text{J}\cdot\text{K}^{-1}$
- (D) $\text{W}\cdot\text{m}^{-1}\cdot\text{K}^{-1}$

Question A11.

0.1944 kg of H_2O is stored in a rigid vessel at 1.0 MPa , 100°C . Is this?

- (A) Superheated vapour ?
- (B) Sub-cooled liquid ?
- (C) Saturated vapour ?
- (D) Saturated liquid ?

Question A12.

A rigid tank contains a saturated mixture of liquid and vapour water at 500 kPa . The dryness fraction x is 0.10 . What is the specific volume of the mixture?

- (A) $0.03749\text{ m}^3\cdot\text{kg}^{-1}$
- (B) $0.3541\text{ kg}\cdot\text{m}^{-3}$
- (C) $3.565\text{ m}^3\cdot\text{kg}^{-1}$
- (D) $0.03847\text{ m}^3\cdot\text{kg}^{-1}$

Question A13.

The atmospheric pressure levels at the top floor and the bottom floor of a tall building were measured using a barometer at 98.03 and 99.20 kPa respectively. The density of air was determined as $1.193\text{ kg}\cdot\text{m}^{-3}$. What is the height of the building?

- (A) 981 m
- (B) 119 m
- (C) 100 m
- (D) 12.7 m

Question A14.

0.5 kg of water is contained in a rigid vessel at a temperature of 125°C and a pressure of 232.1 kPa . The specific enthalpy is $1050\text{ kJ}\cdot\text{kg}^{-1}$. Which of the following could also be correct?

- (A) $v = 0.001065\text{ m}^3\cdot\text{kg}^{-1}$
- (B) $v = 0.7706\text{ m}^3\cdot\text{kg}^{-1}$
- (C) $x = 0.5$
- (D) $x = 0.24$

Question A15.

The specific enthalpy of 3.0 kg of water contained in a volume of 2.4 m^3 at 200 kPa is

- (A) $504.7\text{ kJ}\cdot\text{kg}^{-1}$
- (B) $2493.3\text{ kJ}\cdot\text{kg}^{-1}$
- (C) $2706.7\text{ kJ}\cdot\text{kg}^{-1}$
- (D) $0.8\text{ m}^3\cdot\text{kg}^{-1}$

Question A16.

Heat is added to a closed cylinder of constant volume containing 0.718 kg of air. What will be the heat input needed to increase the temperature of the air from 20°C to 100°C ?

- (A) 41.24 kJ
- (B) 72.16 kJ
- (C) 57.73 kJ
- (D) 57.44 kJ

Question A17.

The quality of a liquid-vapour mixture in equilibrium is?

- (A) The volume fraction in vapour form (%)
- (B) The volume fraction in liquid form (%)
- (C) The mass fraction in liquid form (%)
- (D) The mass fraction in vapour form (%)

Question A18.

0.8 kg of liquid water at atmospheric pressure is heated electrically in an insulated kettle from 17.5 to 75°C over a time period of 80.1 seconds. What average electric power is required?

- (A) 1.2 kW
- (B) 1.8 kW
- (C) 2.4 kW
- (D) 3.0 kW

Question A19.

Which of the following is not a component of a vapour compression refrigeration machine?

- (A) Compressor
- (B) Evaporator
- (C) Condenser
- (D) Turbine

Question A20.

A domestic refrigerator with a coefficient of performance of 2.25 is being used to cool 30.2 kg of apples from 25.1°C down to 3°C. Estimate the total cost of electricity required for the refrigerator to cool the apples. The specific heat of apples is 3.65 kJ·kg⁻¹·K⁻¹ and the cost of electricity is €0.2 per kWh.

- (A) €0.0003
- (B) €0.06
- (C) €0.36
- (D) €1.20

SECTION B (50 Marks) (please use an Answer Book)

Marks for Section B are based on any two Questions (25 marks each)

Question B1 (25 Marks)

A heater provides 400 W of heating in the space shown on the left hand side of **Figure a**. This space has one wall which is adjacent to an unheated space which itself has only one external wall. All the surfaces except walls A and B are adiabatic. Steady state conditions apply.

Wall B of is constructed of face brick (10 cm thickness) and concrete block (30 cm thickness) with an air-filled cavity (5 cm thickness) as shown in **Figure b**. The interior and exterior convection coefficients are 8.6 W·m⁻²·K⁻¹, and 35 W·m⁻²·K⁻¹, respectively. The brick thermal conductivity is 0.85 W·m⁻¹·K⁻¹, the concrete block thermal conductivity 1.25 W·m⁻¹·K⁻¹, and the air cavity thermal effective conductivity is equivalent to 0.25 W·m⁻¹·K⁻¹.

Wall A is constructed by a single layer of brick (the same face brick as that in wall B) and the interior convection coefficients may be assumed to be all equal.

The surface areas of walls A and B are both equal at 20 m². Assume that the rooms are perfectly air tight. The external ambient temperature is 0°C.

**Figure a.****Figure b.**

- (a) What are the U-values of the two walls?
- (b) What is the temperature T_2 of the air in the unheated room?
- (c) What is the temperature T_1 of the air in the heated room?

- (8 marks)
- (12 marks)
- (5 marks)

Question B2 (25 Marks)

Explain briefly what is meant by the term “Ideal Gas” and give an appropriate equation of state, indicating clearly the units used for each property.

(5 marks)

Also for ideal gases, draw sketches illustrating;

- (i) the shape of a line of constant pressure on plot of temperature as a function of specific volume (T - v) for an ideal gas, and

(4 marks)

- (ii) the shape of a line of constant temperature on a plot of pressure against specific volume (P - v), also for an ideal gas.

(4 marks)

Specific volume data for H_2O vapour is available from Thermodynamic property data tables. Estimates may also be made by assuming ideal gas behaviour.

For H_2O at each of two states (1 & 2) given below, find

- (a) the specific volume from the data tables, (4 marks)

- (b) the specific volume calculated using the ideal gas equation and, (4 marks)

- (c) the percentage error involved in assuming ideal gas behaviour. (4 marks)

State 1: 200 kPa, 120.23°C

State 2: 10 MPa, 500°C

Question B3 (25 Marks)

List the conditions to be met for a thermodynamic process to be accurately described as a steady state, steady flow process. Write down a mathematical expression for the First Law of Thermodynamics as applied to such a process, explaining clearly the notation and sign conventions used.

(8 marks)

Consider steady state, steady flow of steam through a turbine used for electricity generation. You may assume that the process is adiabatic. The steam inlet and exit conditions are listed below;

	Inlet	Exit
Pressure (MPa)	10.0	0.1
Temperature (°C)	500	
Velocity (m/s)	20	20
Dryness Fraction		0.92

Making use of the Data Tables given at the end of this paper, determine;

- (i) The outlet temperature of the steam (°C), (5 marks)

- (ii) The change in specific enthalpy of the steam (kJ/kg), (5 marks)

- (iii) The mass flow rate of steam required to yield a turbine mechanical power output of 5.0 MW (Neglecting potential energy changes and any mechanical friction losses in the turbine).

(7 marks)

Properties of H₂O

Table 1: Saturated Water & Steam

MEEN 10050 - Energy Engineering Formulae

Heat Transfer

Conduction: $\dot{Q}_{\text{conduction}} = -k.A \frac{dT}{dX}$

Convection: $\dot{Q}_{\text{conv}} = h.A.(T_{\text{surface}} - T_{\text{fluid}})$

Radiation: $\dot{Q}_{\text{radiation-net}} = \epsilon_s \cdot \sigma \cdot A_s \cdot (T_s^4 - T_{\text{surr}}^4)$

Stefan-Boltzmann Const. $\sigma = 5.67 \times 10^{-8} \text{ W.m}^{-2}\text{K}^{-4}$

Thermal Resistances ($\text{K} \cdot \text{W}^{-1}$): $R_{\text{cond}} = \frac{L}{k.A}$

$R_{\text{conv}} = \frac{1}{h.A}$

Resistances in Series: $R_{\text{total}} = R_1 + R_2 = \sum R$

In Parallel: $\frac{1}{R_{\text{total}}} = \left(\frac{1}{R_1} + \frac{1}{R_2} \right) = \frac{R_1.R_2}{R_1 + R_2}$

Overall: $\dot{Q} = U.A.\Delta T_{\text{overall}}$

$\dot{Q} = \frac{\Delta T_{\text{overall}}}{R_{\text{total}}}$

$U.A = 1/R_{\text{total}}$

Single-Layer Plane Wall:

$\dot{Q} = \frac{(T_i - T_o)}{\left(\frac{1}{h_i.A} + \frac{\Delta x}{k_w.A} + \frac{1}{h_o.A} \right)}$

$\frac{1}{U.A} = \frac{1}{h_i} + \frac{\Delta x}{k_w} + \frac{1}{h_o}$

Multi-Layered Plane Wall:

$R_{\text{total}} = R_{\text{conv},1} + R_{\text{wall},1} + R_{\text{wall},2} + R_{\text{conv},2} = \frac{1}{h_1.A} + \frac{L_1}{k_1.A} + \frac{L_2}{k_2.A} + \frac{1}{h_2.A}$

Ideal Gases:

$P.v = RT$

$P.V = m.R.T$

$C_{P_0} = C_{v_0} + R$

$du = C_{v_0}.dT$

$dh = C_{P_0}.dT$

$u = \int_0^T C_{v_0} dT = C_{v_0}.T$

Specific Heats:

$C_{v_0} = \left(\frac{\partial u}{\partial T} \right)_{v=\text{const}}$

$C_{P_0} = \left(\frac{\partial h}{\partial T} \right)_{P=\text{const}}$

Mixtures of Liquid & Vapour:

Specific Volume

$v_{\text{mix}} = v_f + x.v_{fg}$

$v_{fg} = v_g - v_f$

$V = m.v$

Specific Internal Energy

$u_{\text{mix}} = u_f + x.u_{fg}$

$u_{fg} = u_g - u_f$

$U = m.u$

Specific Enthalpy $h = u + P.v$

$h_{\text{mix}} = h_f + x.h_{fg}$

$h_{fg} = h_g - h_f$

$H = m.h$

Specific Entropy

$s_{\text{mix}} = s_f + x.s_{fg}$

$s_{fg} = s_g - s_f$

$S = m.s$

$dS = \left(\frac{\delta Q}{T} \right)_{\text{int. rev}}$

$x = (m_{\text{vapour}})/(m_{\text{total}})$

Work: $\delta W = \int P.dV$ (rev) ${}_1W_2 = \int_1^2 \delta W = \int_1^2 P.dV$ ${}_1W_2 = P(V_2 - V_1)$ {constant P}

${}_1W_2 = \frac{P_2.V_2 - P_1.V_1}{1-n}$ {polytropic: $P.V^n = \text{constant}$, $n \neq 1.0$ } ${}_1W_2 = P_1.V_1 \cdot \ln\left(\frac{V_2}{V_1}\right)$ {P.V=constant}

$W_{\text{net cycle}} = \oint_{\text{cycle}} P.dV$ $P = \omega.T = 2.\pi.N.T$

First Law: $\oint \delta Q = \oint \delta W$ (cycle) $\delta Q = dE + \delta W$ (process)

First Law - System: ${}_1Q_2 = U_2 - U_1 + \frac{m(\bar{V}_2^2 - \bar{V}_1^2)}{2} + m.g.(Z_2 - Z_1) + {}_1W_2$ $\dot{Q} = \frac{dE}{dt} + \dot{W}$

First Law - Control Volume:

$$\dot{Q}_{cv} + \sum \dot{m}_i \left(h_i + \frac{\bar{V}_i^2}{2} + gZ_i \right) = \sum \dot{m}_e \left(h_e + \frac{\bar{V}_e^2}{2} + gZ_e \right) + \dot{W}_{cv} + \frac{d}{dt} \left(U + m.\bar{V}^2/2 + m.g.Z \right)$$

SSSF: $\dot{Q}_{cv} + \sum \dot{m}_i \left(h_i + \frac{\bar{V}_i^2}{2} + gZ_i \right) = \sum \dot{m}_e \left(h_e + \frac{\bar{V}_e^2}{2} + gZ_e \right) + \dot{W}_{cv}$

$\dot{m} = \rho.A.\bar{V}_{\text{average}}$ **SSSF** $q_{cv} + h_i + \frac{\bar{V}_i^2}{2} + gZ_i = h_e + \frac{\bar{V}_e^2}{2} + gZ_e + w_{cv}$

Heat Engines: 1st Law: $\dot{W}_{\text{net,out}} = \dot{Q}_{\text{in}} - \dot{Q}_{\text{out}}$ **Efficiency:** $\eta_{\text{th}} = \frac{\dot{W}_{\text{net,out}}}{\dot{Q}_{\text{in}}} = \frac{W_{\text{net,out}}}{Q_{\text{in}}} = \frac{Q_{\text{in}} - Q_{\text{out}}}{Q_{\text{in}}} = 1 - \frac{Q_{\text{out}}}{Q_{\text{in}}}$

I.C. Engine $\dot{W} = \omega.T = 2.\pi.N.T$ {N in rev.s⁻¹} $i.m.e.p = \frac{\oint_{\text{cycle}} P.dV}{V_d}$ $i.m.e.p = \frac{P_i}{\left(\frac{N}{n_r} \right) V_d}$

Refrigeration: $C.O.P._R = \frac{\dot{Q}_L}{\dot{W}_{in}}$ **Heat Pump:** $C.O.P._{HP} = \frac{\dot{Q}_H}{\dot{W}_{in}}$

Additional Data which may or may not be required. (Sections A and B)

M _{water vapour (H2O)}	= 18.0 kg.kmol ⁻¹

C _p for air	= 1005 J.kg ⁻¹ .K ⁻¹
C _v for air	= 718 J.kg ⁻¹ .K ⁻¹
C _p for liquid water	= 4180 J.kg ⁻¹ .K ⁻¹
C _p for nitrogen	= 1039 J.kg ⁻¹ .K ⁻¹
C _v for nitrogen	= 743 J.kg ⁻¹ .K ⁻¹
C _p for carbon dioxide	= 846 J.kg ⁻¹ .K ⁻¹
C _v for carbon dioxide	= 657 J.kg ⁻¹ .K ⁻¹
Acceleration due to gravity g	= 9.81 m.s ⁻²
Standard Atmospheric Press.	= 101.325 kPa (760 mm Hg)
Approx. composition of air:	3.76 kmol N ₂ : 1 kmol O ₂
